MOS INTEGRATED CIRCUIT

μPD4711B

RS-232 LINE DRIVER/RECEIVER

The μPD4711B is a high-voltage silicon gate CMOS line driver/reciever conforming to the EIA/TIA-232-E standard. It can operate with a single +5 V power source because it is provided with a DC-DC converter. In addition, this line driver/receiver has many ancillary functions, including output control, threshold select, and standby functions. Because the μPD4711B is provided with two output driver circuits and two receiver circuits, it can constitute an RS-232 interface circuit with a single chip.

FEATURES

- Conforms to EIA/TIA-232-E (RS-232C) standard
- +5 V single power source
- Threshold select pin selecting two types of threshold voltages
- Standby mode can be set by making standby pin high to reduce circuit current.
- Three-state output configuration. Both driver and receiver outputs go into high-impedance state in standby mode.

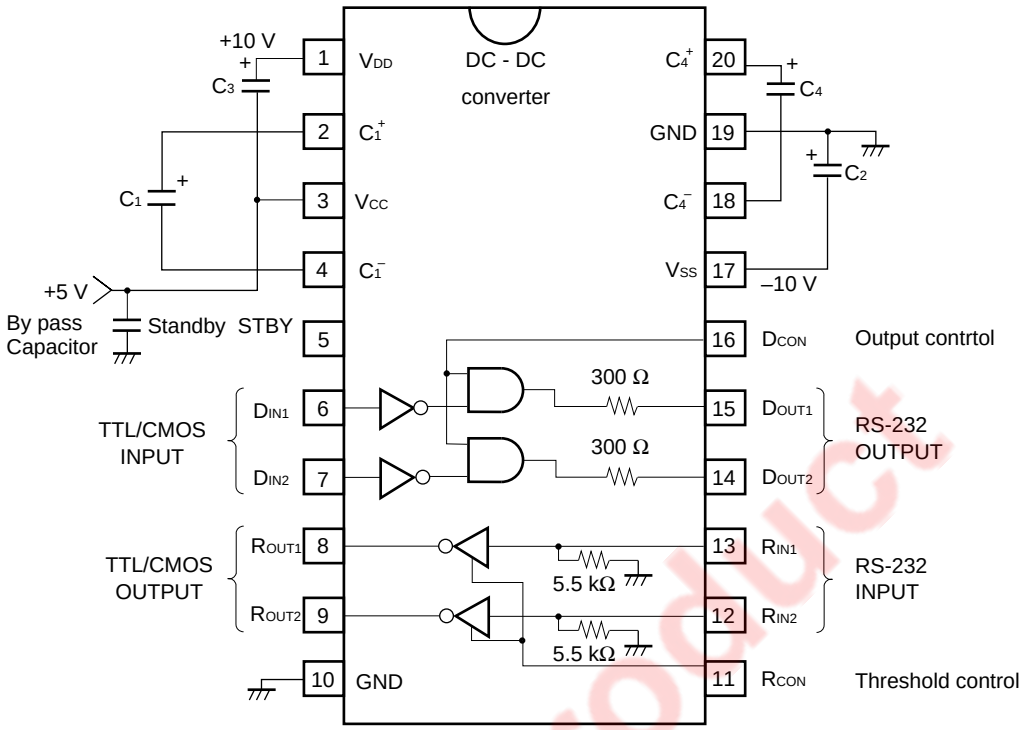
BLOCK DIAGRAM/PIN CONFIGURATION (Top View)



***** V_{DD} and V_{ss} are output pins of voltages internally boosted. Connecting a load directly to these pins is not recommended.

****** The standby pin is internally pulled down.

******* Use capacitors with a working voltage of 16 V or higher as C_1 through C_4. Insert a bypass capasitor about 0.1 to 1 μF between V_{CC} pin to GND pin.
